

Installation Instructions

CD200D Digital Ignition System

Form CD200D II 8-14

altronic
CD200D IGNITION

P/N S/N

CERTIFIED CLASS I DIV.2
US GRPS C&D, T4
RATED: 12-30VDC, 4 AMPS MAX.
RATED AMBIENT: -40 TO +85 DEGREES C.
WARNING - EXPLOSION HAZARD - SUBSTITUTION OF COMPONENTS MAY IMPAIR SUITABILITY FOR CLASS I, DIVISION 2.
WARNING - EXPLOSION HAZARD - DO NOT CONNECT WHILE CIRCUIT IS LIVE UNLESS AREA IS KNOWN TO BE NON-HAZARDOUS.
MUST BE INSTALLED PER FORM CD200D II.
INSTALLÉ CONFORMÉMENT FORM CD200D II.
ALTRONIC, LLC GIRARD, OHIO USA
U.S. PATENT NO. 5,623,209

1.0 DESCRIPTION

- 1.1 This manual provides installation and operating instructions for the Altronic CD200D ignition system. It is recommended that the user read this manual in its entirety before commencing operations.
- 1.2 The Altronic CD200D ignition system consists of these basic components:
 - CD200D Unit - 791090-x (see FIG. 1)
 - Magnetic Pickup Sensor or Hall-effect pickup (one per system)
 - Input Harness (one per system, specific to pickup type)
 - Output Harness (one per system)
 - Ignition coils (one per cylinder)
- 1.3 The system requires a battery or a suitable power supply with a nominal 12 Vdc or 24 Vdc (see FIG. 2). The CD200D unit steps up the DC supply voltage to charge an energy storage capacitor and contains a microprocessor and solid-state switching devices to release the stored energy to the ignition coils in programmed, timed sequence according to the application. Holes (one per cylinder) in a special timing disc signal the position of the engine crankshaft to the electronic circuitry in the CD200D unit. One additional hole trails after the last cylinder hole; this is the index signal that another revolution has started. An Altronic manufactured magnet disc should be used when employing a Hall-effect pickup. Ignition timing may be varied by means of a manual switch, an analog timing signal and/or engine RPM.
- 1.4 The CD200D system can operate as a single-firing or double-firing (firing on exhaust stroke) system up to sixteen (16) cylinders. These instructions detail 8-, 12-, and 16-cylinder, single-firing applications using CD200D units 791090-8, 791090-12, 791090-16.
- 1.5 As shipped from the factory, the CD200D is in the auto-detect mode and is set up for a trigger disc running at camshaft speed (see SECTION 9.5). The setup is programmable by the use of the PC compatible CD200D terminal program (see FIG. 9) provided on a CD delivered with the unit. The programming of the unit is done via the RS-485 Modbus compatible communications port.

WARNING: DEVIATION FROM THESE INSTRUCTIONS MAY LEAD TO IMPROPER OPERATION OF THE MACHINE WHICH COULD CAUSE PERSONAL INJURY TO OPERATORS OR OTHER NEARBY PERSONNEL.

NOTE: If possible, keep the original shipping container. If future transportation or storage is necessary, this container will provide the optimum protection.

2.0 CD200D UNIT

- 2.1 Select a location for the CD200D unit that will be at least 24 inches (600mm) away from the ignition coils and spark plug leads. In addition, the mounting location must be relatively cool, preferably one benefitting from the engine fan stream (if any); the outside case temperature of the CD200D unit should not exceed 185°F. (85°C.) in continuous operation.
- 2.2 Secure the CD200D unit to a suitable mounting bracket with four ¼-inch (6 mm) screws. Refer to FIG. 1 for CD200D unit dimensions.

3.0 PICKUP SENSOR – CAMSHAFT DISC

- 3.1 **MAGNETIC Pickup** – A disc with the appropriate hole pattern must be prepared for mounting at CAMSHAFT speed. The disc must be of magnetic material and 4.0" (100mm) diameter or larger. FIG. 3 details the hole spacing depending on the number of engine cylinders. Note the direction of rotation of the disc. The angular spacing is extremely important as this establishes the basic timing accuracy of the system.
- 3.2 Locate a suitable mounting position for the pickup sensor in order to sense the holes in the rotating disc. Secure the pickup to a rigid bracket or surface. See FIG. 3 for the dimensions of the ¾"-16 pickup sensors.

NOTE: Some MAN engines have a 12 mm thread port; use Altronic pickup 791041-3.

- 3.3 Set the engine with no. 1 cylinder in the most advanced timing position. Noting the direction of rotation, set the drilled disc opposite the pickup in the position shown in FIG. 3. Some 12- and 16-cylinder engines may require line up on a different cylinder, typically the second cylinder in the firing order.
- 3.4 Adjust the tightening nut holding the pickup sensor to maintain an air gap as specified below:
- For 3/4" magnetic pickups 791015-1 and 791016-2, the gap shall be set to .020" ± .005" (0.50mm ± 0.12mm).
 - For magnetic pickups 791035-2 and 791041-3 (12mm thread), the gap shall be set to .014" ± .004" (0.35mm ± 0.10mm).

The center of the pickup face must line up with the center of each drilled hole as the disc rotates.

- 3.5 Plug the 2-pin pickup connector fully into the mating connector of the CD200D wiring harness.
- 3.6 ALTERNATIVE HALL EFFECT Pickup AND MAGNET DISC – On 4-cycle engines, the disc mounts to the camshaft or other shaft operating at one-half engine speed. On 2-cycle engines, the disc mounts to the engine crankshaft.
- 3.7 Set the engine with no. 1 cylinder 2.0 crankshaft degrees, 4-cycle or 1.0 degree, 2-cycle ahead of the most advanced desired timing point on the compression stroke. This is the point where the Hall-effect pickup must line-up with the edge of the magnet next to the "x" on the O.D. of the disc. When mounting the magnet disc, be sure to observe the rotation indication marked on the disc.
- 3.8 Mount the Hall-effect pickup sensor, FIG. 4, securely to a rigid bracket or surface to maintain an air gap not exceeding .040" (1.0mm). The center of the pickup face must also line up with the center of the disc as it rotates.
- 3.9 Plug the cable for the pickup into the 6-pin connector of the CD200D unit; the 3-pin connector end plugs into the Hall-effect pickup.

NOTE: Keep the pickup sensor wires at least 2" (50 mm) away from the coil primary wires and at least 8" (200 mm) away from the spark plug leads.

NOTE: On certain 12- and 16-cylinder engines, a cylinder other than no. 1 (typically the second cylinder in the firing order) must be used when lining up the disc and pickup.

4.0 IGNITION COILS

- 4.1 USE ONLY THE ALTRONIC COILS INDICATED HERE:
- UNSHIELDED: 501061, 591010, 591040
 - FLANGE: 591012, 591018
 - SHIELDED: 501061-S, 591010-S
 - INTEGRAL: 591007, 591011A, 591011B
- 4.2 Mount the ignition coils as close to the spark plugs as possible keeping the high-tension lead length to a minimum but also keeping temperatures below 200°F. (95°C.) during operation.

5.0 PRIMARY WIRING

- 5.1 The CD200D system requires a battery or other DC power source providing 12-30Vdc for running and a minimum of 8 volts for engine starting. Refer to FIG. 2 for details of the connection to the DC power source.
- 5.2 Primary wiring hookup is shown in the wiring diagram template – FIGS. 5 or 6.

Use the table below to record the actual firing order and wiring.

791090-8	A	B	C	D	E	F	K	L
Engine Cyl. No.								

791090-12	A	B	C	D	E	F	K	L	M	N	P	R
Engine Cyl. No.												

791090-16	A	B	C	D	E	F	K	L	M	N	P	R	S	T	U	V
Engine Cyl. No.																

The common coil ground lead on all units is the J harness lead.

- 5.3 All connections at unshielded coils should be made using ring-type terminals specified for 16 AWG (1.5 sq. mm) wire and #10 (5mm) stud size. Terminals should either be soldered to the wire or attached with an appropriate staking tool. Protect primary wiring from physical damage, vibration and temperatures in excess of 200°F. (95°C.).
- 5.4 For details of the hookup for the analog timing signal, see FIG. 7.

6.0 SHUTDOWN WIRING

- 6.1 The CD200D system is shut-off by interrupting the DC power to the unit; use a switch or relay with contacts rated 24Vdc, 10 amps - refer to FIG. 2.
- 6.2 The CD200D can also be shutdown by using the G-lead of the output harness. To shutdown the unit, connect the G-lead of the output harness to ground. The CD200D will draw about 0.1 ampere from the power source when shutdown, see FIG. 5 or 6.

7.0 SECONDARY WIRING

- 7.1 With unshielded coils, spark plug leads should be fabricated from 7mm, silicone insulated, ignition cable with suitable terminals and silicone spark plug boot.
- 7.2 Keep spark plug leads as short as possible and at least 2" (50mm) away from any grounded engine part. In deep spark plug wells, use rigid, insulated extenders projecting out of the well.
- 7.3 The use of a clear, silicone grease (such as Dow Corning DC-4, G.E. G-623 or GC Electronics Z5) is recommended for all high-tension connections and boots. This material helps seal out moisture and prevent corrosion from atmospheric sources.

WARNING: THE HOOKUP SHOWN IS FOR THE MOST COMMON ENGINE FIRING ORDER. CONNECT TO THE IGNITION COILS ACCORDING TO THE ACTUAL ENGINE FIRING ORDER.

See section 9.21 for details on programming the slave firing angle and for special wiring instructions.

NOTE: Keep the primary wiring at least 2" (50mm) away from the spark plug leads.

NOTE: Do NOT run the input power line through a series of normally closed switches.

NOTE: The CD200D should not be used to power ignition-powered panel instruments.

NOTE: The use of resistance spark plug cable or individual 5,000 ohm resistors (mounted either at the spark plug or coil) is recommended.

8.0 OPERATION

- 8.1 **IGNITION DELAY:**
On cranking, there will be a delay of two disc revolutions—after the power is ON and the engine begins rotating—before the CD200D unit commences outputs to the ignition coils. This delay is to allow identification of the pickup index hole to insure proper synchronization with the engine. A greater delay of more revolutions to allow for engine purging can be added to the programming. See section 9.10.
- 8.2 **MANUAL TIMING SWITCH:**
The CD200D unit has a TIMING switch located under a white plastic cap at the end of the case. Using a timing light, set the timing to the desired position with the engine running at NORMAL OPERATING SPEED. Replace the white cap over the timing switch once the proper timing is set. Switch position 7 gives the most advanced timing. The timing retards approximately one (1) engine degree for each switch position as the switch is moved to position 6, 5, 4, 3, 2, 1, 0. Switch position 0 is full retard. Larger timing changes per switch position can be programmed. See section 9.15.
- 8.3 **ANALOG TIMING ADJUSTMENT: (REFER TO FIG. 7)**
The CD200D unit provides for analog timing adjustment in two ways:
- 0-1,000 ohm potentiometer connected between terminals E and F of the input harness.
 - 4-20 mA signal applied to leads F and G of the input harness.
- 8.4 **RPM BASED TIMING CURVE:**
The CD200D unit is shipped with an RPM-based timing curve (default programming) providing a 6-degree advance as the engine speed increases from 0 to 600 RPM (FIG. 7). This timing change is in addition to changes made with the manual switch (section 8.2) or the analog timing input (section 8.3).

NOTE: On the first start-up after system installation, verify correct ignition timing by cranking the engine with the fuel supply shut off.

NOTE: DO NOT switch from position 7 to 0, or 0 to 7 while the engine is running. The large timing change may cause the engine to shutdown or be damaged.

NOTE: The analog timing retard is added to the retard established by the manual timing switch (see section 8.2 and FIG. 9).

NOTE: When checked at different speeds, timing will vary in accordance with the programmed RPM curve indicated.

9.0 CUSTOMIZING THE CD200D UNIT

- 9.1 **TERMINAL PROGRAM SETUP:**
The CD200D is designed to be programmed by a Personal Computer via the RS-485 Modbus communications link. See FIG. 8 for the proper hookup. The CD200D unit case must be securely grounded prior to programming.
- The Terminal Program is included on the CD-ROM supplied with each CD200D unit. The first time that the terminal software is used on a PC, the Communications Port settings must be configured in order to establish communications. After loading the Terminal Program from the CD-ROM, click on the Connection icon on the upper tool bar. The Connection Setup window will appear. The port being selected for use with the CD200D should also be set for 9600 baud, no parity, 200 ms time out (8 data bits and 1 stop bit). The PC will now be set to communicate with the CD200D. Set the ID# for the CD200D to 01.
- 9.2 **PROGRAMMING CUSTOM VALUES:**
A variety of numeric parameters can be entered by the user for customized applications or the unit can be left at the factory default settings. Changes to numeric values are made by placing the cursor in the appropriate box and typing in the new value. When the new numeric value is first typed, it appears in red text on the PC screen. The values appearing in red have not yet been sent to the CD200D unit, but are being stored on the PC until being sent. Hitting the Enter key sends the selection to the CD200D. The entered value turns green on the PC display, indicating that the new value has been successfully communicated to the CD200D and stored.
- 9.3 **SELECTING OPTIONAL FEATURES:**
Other OFF/ON programming selections are made by activating or deactivating a blue status flag on the PC screen. When the mouse pointer is located over the status flag, a double-left click activates the status flag and makes it appear to be "ON" or glowing on the PC screen, a double-right click deactivates the feature and the status flag.

NOTE: In order to program the values, the CD200D must be powered. Care should be taken in changing entries when the engine is operational to avoid unstable or dangerous operating conditions.

- 9.4 Pickup TYPE SELECTION:
OFF/ON programming selection to enable the use of a Hall-effect pickup.
Requires proper harness.
- 9.5 DISC TYPE SETTING:
This numeric entry configures the Disc Type (number of holes or protrusions) on the timing disc, excluding the index. This number is normally equal to the number of cylinders on the engine for a camshaft mounted disc when the engine is even firing, and half the number of cylinders when it is odd-firing and requires the programming of a "slave angle". 4-cycle crankshaft mounted discs or holes in a flywheel can only be used on even firing applications and cannot be used with "slave angles". This value is used to test for the correct disc and scales the rpm measurement and ignition timing angles to the specific disc chosen. Default setting = (O+1).
- Entering a value of Zero (O+1), places the ignition in auto detect mode. In auto detect mode, the ignition will automatically scale rpm measurement and ignition timing angles to the disc pattern observed.
- 9.6 Test Disc Flag:
When this status flag is ON, the CD200D will test for a match of the incoming signal pattern observed by the CD200D to the Disc Type specified. When enabled, this test is performed after synchronization to the disc pattern and before initiating firings. When the pattern does not match the setting, the ignition will not fire and the diagnostic LED on the unit will signal the error by turning off until rotation stops. Once the ignition is firing, the disc pattern will be monitored continuously and, if an error is detected, the unit will stop firing and the alarm output switch will open. Firings will be inhibited and the output switch will remain off for 5 seconds after input signals cease.
- If the shutdown lead is grounded after the unit is firing, the firings will stop, the output switch will open and remain open for 5 seconds after rotation stops.
- The diagnostic LED on the unit will turn off until rotation stops. After rotation stops it will blink the appropriate signal, see section 11.2. Default setting = OFF.
- 9.7 On Crank Flag:
When this status flag is ON, the ignition scales rpm measurement and timing angles for a signal pattern coming from a crankshaft-mounted disc. When this status flag is OFF, the ignition scales rpm measurement and timing angles for a signal pattern from a camshaft mounted disc. Default setting = OFF.
- 9.8 Line Up Angle:
This numeric entry has no impact on actual engine timing and is only used as a reference to calculate the spark timing number for display in the Terminal Software. When the pickup is aligned with the first hole or protrusion on the timing disc, the Line Up Angle is the angular position of the crankshaft with respect to TDC of the first cylinder in the firing order. Entry range is 0 to 100 engine degrees BTDC. This value will need to be fine-tuned to provide an accurate display of timing. Default setting = 40.0 degrees BTDC.
- 9.9 Insertion Retard Setting:
This numeric entry configures the minimum internal electronic input signal delay. Entry range is 2.0 to 25.5 degrees of engine retard. Default setting = 2.0 degrees.
- 9.10 Purge Delay Setting:
This numeric entry configures the number of disc rotations (engine cycles) following successful synchronization to delay before ignition outputs begin. Entry range is 0 to 255 cycles. Default setting = 0.
- 9.11 Overspeed Setting:
This numeric entry configures the engine rpm at which the ignition will stop firing outputs due to an overspeed condition. The overspeed condition also turns off the alarm output switch. When rotation has fully stopped, the LED on the CD200D unit will blink the appropriate code and the alarm output switch is restored to normal (closed). Default setting = 2200 RPM.

NOTE: Pickup type selection is critical and must be properly configured to match the pickup type in use.

NOTE: Conversion from some DISN applications will require a new disc with half the number of cylinders if slave angles are required!

NOTE: The disc test for a specific number of pulses is not performed in auto detection mode (0 entry for Disc Type Setting – section 9.5).

- 9.12 **Run Speed Setting:**
This numeric entry configures the transition speed from crank to run. This setting also determines the transition of the diagnostic LED on the CD200D from crank to run modes. Default setting = 500 RPM.
- 9.13 **Low Voltage Setting:**
This numeric entry configures the threshold for the low voltage diagnostic of the DC input voltage to the CD200D. If the DC voltage decreases to this setting, the diagnostic LED on the CD200D will blink the appropriate code. The CD200D will continue to try to fire outputs regardless of the voltage. Default setting = 6 volts.
- 9.14 **Enable LED Diagnostics Flag:**
When this LED status flag is activated, the blink code diagnostics for primary and secondary outputs are enabled. Default setting is ON.
- 9.15 **Switch CAL:**
These numeric entries configure the timing retard for each position of the manual timing switch on the CD200D case. Entry range is 0 to 25.5 degrees of engine retard. The active entry is indicated in blue. Default setting is 7-6-5-4-3-2-1. If two degrees change per switch position is desired, enter 14-12-10-8-6-4-2.
- 9.16 **Loop CAL:**
These numeric entries configure the interpolated lookup table for the ignition retard versus the analog current loop input signal. This allows the operator to create custom spark timing maps versus the current loop input signal. Entry range is 0 to 25.5 degrees of engine retard. The active entries are indicated in blue. Default sequence is 0 degrees retard at 4mA, 16 degrees retard at 20mA.
- 9.17 **RPM CAL:**
These numeric entries configure the interpolated lookup table for retard versus the engine speed. This allows the operator to create custom spark timing maps versus engine rpm. Entry range is 0 to 25.5 degrees of engine retard. The active entries are indicated in blue. Default sequence is 6 degrees retard at 0 RPM, decreasing to 0 degrees retard at 600 RPM.
- 9.18 **Cylinder CAL:**
These numeric entries configure the amount of individual offset timing retard added to the global timing for each individual output. This feature can be used to map an evenly spaced timing disc to an odd firing angle engine pattern. Entry range is 0 to 50 degrees of engine retard. Default settings are 0. Contact the factory for further details of this feature.
- 9.19 **Energy Flags:**
Select one of four output energy settings for the CD200D:
- | | | | | |
|-------|-----|-------|-----|------------------|
| Bit 1 | OFF | Bit 0 | OFF | Vcap = 150 volts |
| Bit 1 | OFF | Bit 0 | ON | Vcap = 160 volts |
| Bit 1 | ON | Bit 0 | OFF | Vcap = 170 volts |
| Bit 1 | ON | Bit 0 | ON | Vcap = 180 volts |
- Default setting is 160 volts at the capacitor. This voltage can only be measured using a device with an input impedance of 1 megaohm or higher with no other device connected.
- 9.20 **Enable Slave Firing Flag:**
When this LED status flag is activated, the ignition will generate a second slave firing for each (x+1) reference pulse. For a (6+1) disc pattern, the ignition will fire 12 outputs when this flag is activated, and 6 outputs when this flag is not activated. Modification of this flag through the Terminal Program requires that the engine be stopped and the G-lead be grounded.

9.21 SLAVE FIRING ANGLE SETTING:

This numeric entry configures the angle of the slave firing relative to the standard firings that are generated for each (x+1) reference pulse. Entry range is 25.0° to 60.0° which is used to set the slave firing angle on a 12 or 16-cylinder, 4-cycle engine. The slave angle must be the smaller of the two angles that define the engine firing pattern. For example, firing patterns of either 30°–60° or 60°–30° would require the slave angle be entered as “30”. Modification of this value through the Terminal Program requires that the engine be stopped and the G1 lead be grounded.

NOTE: All 16-cylinder applications must be slave-firing patterns utilizing an 8+1 disc.

Common slave-firing patterns:

NO. CYLS.	Engine Firing Angle	SECT. 9.5 DISC SETTING	SECT. 9.20 SLAVE ANGLE	IN FIRING ORDER, OUTPUT A CONNECTS TO:
8	60°–120°	4+1	60°	First cylinder
8	120°–60°	4+1	60°	Second cylinder
10	54°–90°	5+1	54°	First cylinder
10	90°–54°	5+1	54°	Second cylinder
12	30°–90°	6+1	30°	First cylinder
12	40°–80°	6+1	40°	First cylinder
12	50°–70°	6+1	50°	First cylinder
12	55°–65°	6+1	55°	First cylinder
12	60°–even	6+1	60°	First cylinder
12	75°–45°	6+1	45°	Second cylinder
12	90°–30°	6+1	30°	Second cylinder
16	30°–60°	8+1	30°	First cylinder
16	45°–even	8+1	45°	First cylinder
16	60°–30°	8+1	30°	Second cylinder

10.0 PC TERMINAL DISPLAY FUNCTIONS

- 10.1 Engine Speed:
Indicates current speed of the engine in RPM based on disc signal.
- 10.2 Spark Timing:
Indicates the global spark timing of the engine in degrees before TDC. This number is the LINE UP ANGLE setting less the TOTAL RETARD. Slight differences between this number and the timing reading obtained with a timing light may occur since the LINE UP ANGLE entered may differ slightly from the actual angular position of the engine when the input pulse event is received by the CD200D. In this event, the Spark Timing number should be made to agree with the timing light by changing the LINE UP ANGLE entry.
- 10.3 Switch Position:
Indicates the current position of the manual timing switch on the CD200D case.
- 10.4 Loop Input:
Indicates the value of the external input current loop.
- 10.5 Observed Disc:
Indicates the number of input events (timing holes, protrusions or magnets) being recognized by the CD200D unit on the timing disc input signal at this time.
- 10.6 Insertion Retard:
Indicates the amount of electronic insertion retard at this time.

- 10.7 Switch Retard:
Indicates the amount of timing retard being added by the current timing switch position at this time.
- 10.8 Loop Retard:
Indicates the actual amount of timing retard added from the current loop versus retard lookup table curve at this time.
- 10.9 RPM Retard:
Indicates the actual amount of timing retard being added by the RPM versus retard lookup table curve at this time.
- 10.10 TOTAL Retard:
Indicates the total global timing retard at this time. This number is the sum of the Insertion Retard, Switch Retard, Loop Retard and RPM Retard.
- 10.11 Counter:
Indicates the number of disc rotations (engine cycles) registered since the engine was last started.
- 10.12 Purge Counter:
During a startup, indicates the number of purge cycles remaining before the outputs are activated.
- 10.13 Supply Voltage:
Indicates the measured DC voltage supply level to the CD200D.
- 10.14 Spark Ref. (A, B, C, etc.):
Indicates the current spark reference number for each cylinder.
- 10.15 Syncing:
When red, indicates that engine rotation has been sensed and the synchronization process is taking place.
- 10.16 Insync1:
When red, indicates that the index input has been recognized once.
- 10.17 Insync2:
When red, indicates that the index has been recognized a second time and the ignition is ready to proceed.
- 10.18 Purging:
When red, indicates that synchronization has been completed and the purge cycle countdown is taking place.
- 10.19 Trying:
When red, indicates that the CD200D is trying to fire outputs, but a proper primary discharge event has not yet occurred.
- 10.20 Firing:
When red, indicates that CD200D is successfully firing primary outputs.
- 10.21 LOCKOUT:
When red, indicates that firings are locked out until engine rotation has ceased for a minimum of 5 seconds.
- 10.22 Cranking:
When red, indicates engine rotation below the Run Speed setting.
- 10.23 Running:
When red, indicates engine rotation above the Run Speed setting.
- 10.24 Disc Error:
When red, indicates that the Test Disc status flag is activated and the timing disc pattern being sensed did not match the DISC TYPE selected.

- 10.25 G-Lead:
When red, indicates that the G-lead is grounded.
- 10.26 Remote:
When red, indicates a remote serial shutdown command is active.
- 10.27 SD-Lead:
When red, indicates that a shutdown has occurred which was the result of a grounded G-lead condition.
- 10.28 SD-Remote:
When red, indicates that a shutdown has occurred as a result of a remote serial shutdown command.
- 10.29 SD-Overspeed:
When red, indicates that a shutdown has occurred as a result of the engine reaching the Overspeed setting.
- 10.30 Wdog1:
When red, indicates that the microprocessor has re-booted since the ignition has been powered-up.
- 10.31 Wdog2:
When red, indicates that the microprocessor is currently re-booting. Disregard the first blink when first connecting.
- 10.32 ChkSum:
When red, indicates a software checksum failure of the unit's firmware.
- 10.33 Low Volt:
When red, indicates that the input DC voltage is at or below the Low Voltage setting input.
- 10.34 No Charge:
When red, indicates that the primary storage capacitor has failed to charge properly within the last ~2 seconds.
- 10.35 Primary Open:
When red, indicates that an open primary condition has been detected within the last ~2 seconds.
- 10.36 Primary Short:
When red, indicates that a shorted primary condition has been detected within the last ~2 seconds.
- 10.37 Secondary Open:
When red, indicates that an open secondary condition has been detected within the last ~2 seconds.
- 10.38 Cranks Log:
Indicates the total number of crank attempts seen by the CD200D.
- 10.39 Starts Log:
Indicates the total number of successful starts seen by the CD200D as defined by the Run Speed setting input.
- 10.40 Cycle Log:
Total number of engine cycles seen by the CD200D.
- 10.41 Cold Boot Log:
Indicates the number of times the input DC voltage has been cycled to zero.
- 10.42 Warm Boot Log:
Indicates the number of times the microprocessor has restarted without a complete loss of power.

- 10.43 Graphic Display:
The CD200D Terminal Software provides a real time graphic display of the secondary diagnostic numbers, global engine timing (y-axis/10) and engine speed (y-axis x 10).

11.0 CD200D UNIT LED DIAGNOSTIC BLINK CODES

- 11.1 CD200D IGNITION BLINK CODES:
Whenever the LED Diags status flag is enabled (blue) by using the CD200D Terminal Software, the blinking pattern of the LED on the side of the CD200D case can be used to interpret the general status of the CD200D diagnostics without the use of the Terminal Software. Within each group of conditions described below, the possible diagnostic states are listed according to their number of blinks. The LED is ON for about 2 seconds between each blink sequence and the blinks occur evenly spaced at a faster rate.
- 11.2 LED SIGNALS WITH THE ENGINE STOPPED:
- ON – Steady = READY (new power up or last start attempt aborted)
 - ON – 1 Blink – ON = FIRED LAST TIME ROTATING (stopped due to stall)
 - ON – 2 Blink – ON = SHUTDOWN (By grounding G-LEAD when running)
 - ON – 3 Blink – ON = SHUTDOWN (By Remote Serial Request when running)
 - ON – 4 Blink – ON = SHUTDOWN (By Overspeed when running)
 - ON – 5 Blink – ON = WRONG DISK PATTERN
 - ON – 6 Blink – ON = LOW SUPPLY VOLTAGE (Below Threshold when running)
- 11.3 LED SIGNALS WITH ENGINE CRANKING:
Rotating, and still below running RPM.
- ON/OFF/ON/OFF = PURGING (off first input pulse, toggles each revolution of purge)
 - ON – Steady = FIRING NORMALLY (RPM below running set point value)
 - OFF = WRONG DISC PATTERN DETECTED
- 11.4 LED SIGNALS WITH ENGINE RUNNING:
When firing, and above run speed.
- ON – Steady = FIRING NORMALLY (No Diagnostics to Report)
 - ON – 1 Blink – ON = OPEN SECONDARY ALARM
 - ON – 2 Blink – ON = PRIMARY SHORT ALARM
 - ON – 3 Blink – ON = PRIMARY OPEN ALARM
 - ON – 4 Blink – ON = NO CHARGE ALARM
 - ON – 6 Blink – ON = LOW SUPPLY VOLTAGE

12.0 RS-485 COMMUNICATIONS, MODBUS RTU

- 12.1 The CD200D is compliant to the Modicon Modbus RTU standard. Maximum number of registers that can be read at one time is limited to 32. Maximum number of booleans that can be read at one time is limited to 256. All communications are 8 data bits, no parity, 1 stop bit. The baud rate is 9600. The MODBUS address list follows:
- 12.2 24 READ-ONLY STATUS BITS
 READABLE IN MULTIPLES OF 8 BITS
 STARTING AT 8-BIT BOUNDARIES

WARNING: Writable Modbus registers such as '0XXXX' and '4XXXX' directly reference the CD200D non-volatile memory. Non-volatile memory has a useful life of ~100,000 Write/Erase cycles. Any device writing to these registers must take care to not exceed the maximum number of Write/Erase cycles.
